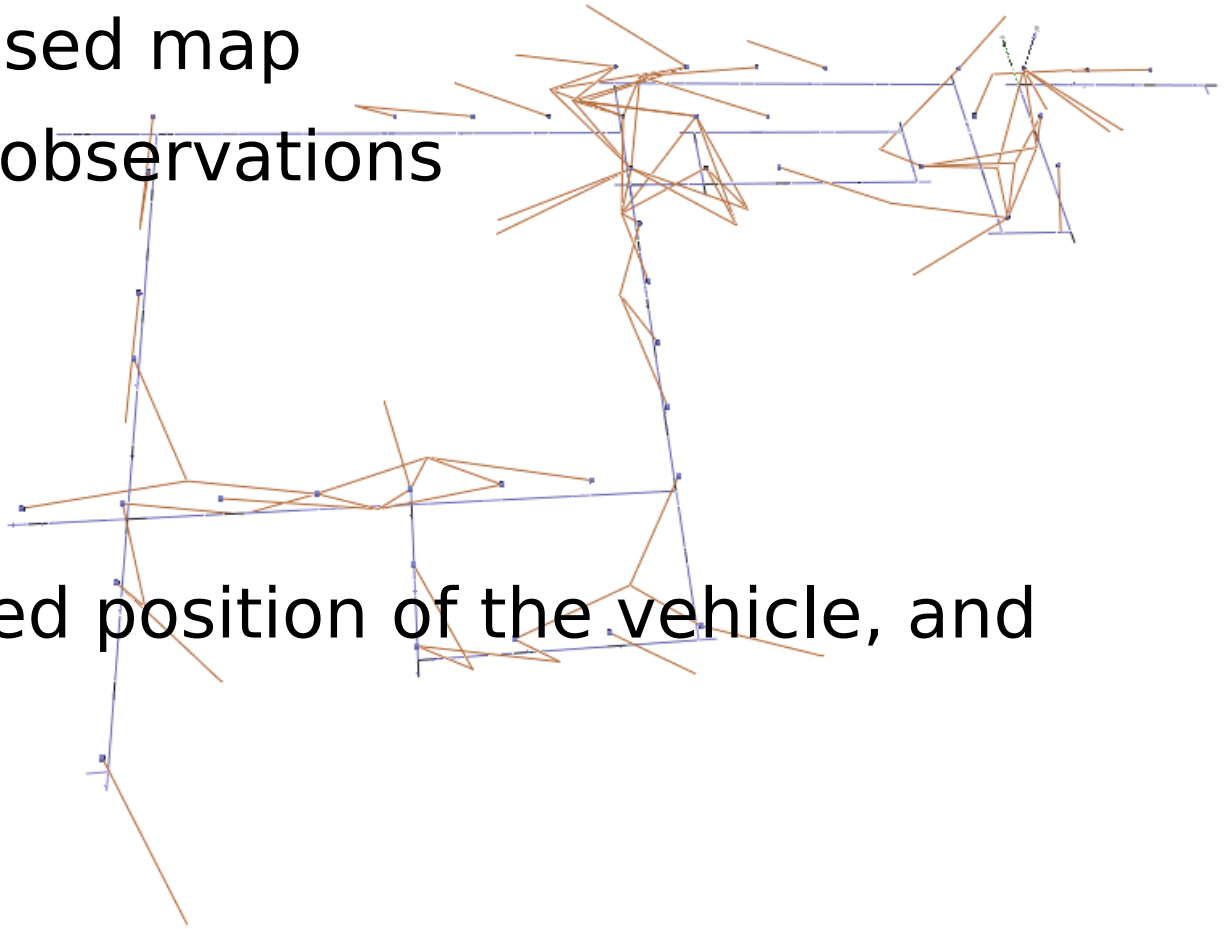
Sapienza University of Rome

#1 Least Squares based 3D Camera Localization

- Input:
  - Landmark based map
  - Anonymized observations
  - Odometry

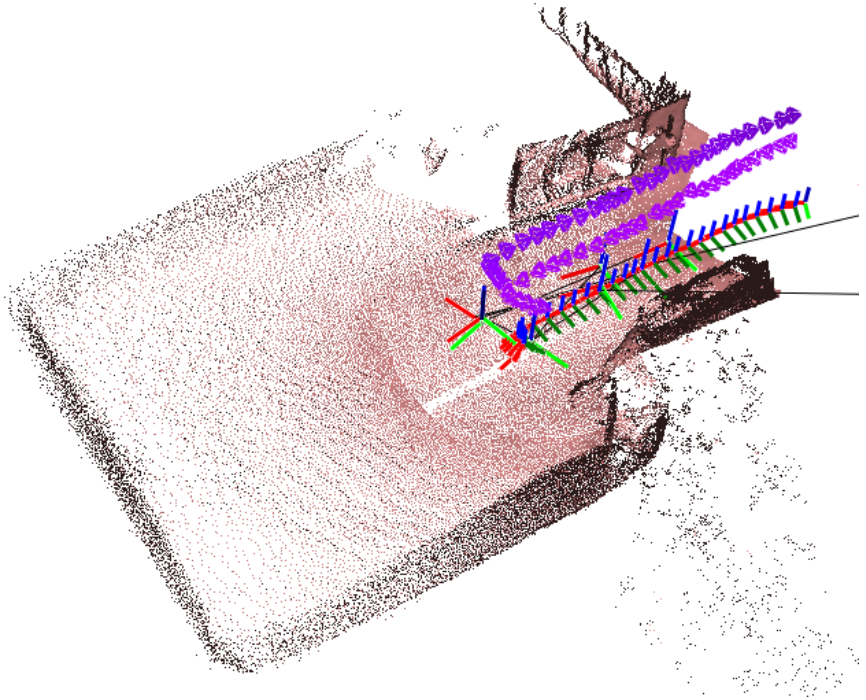


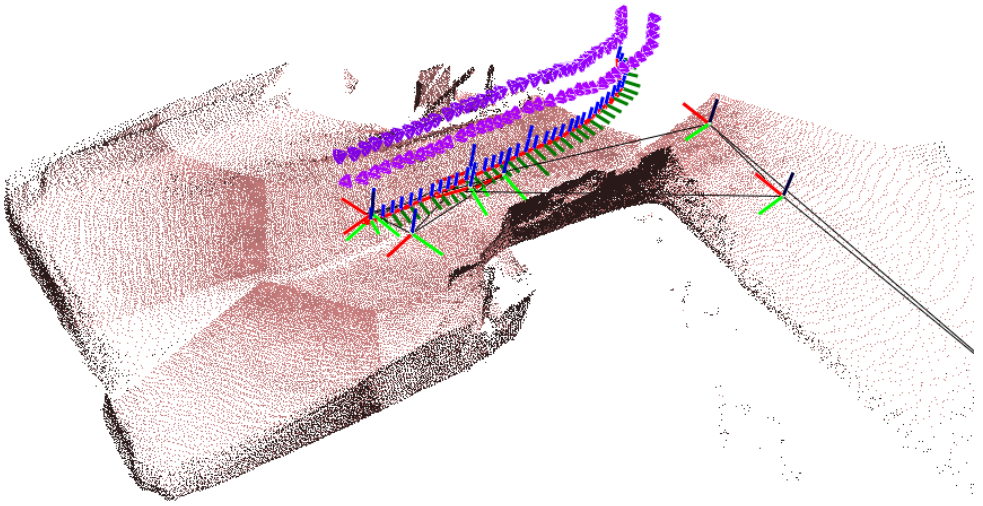
Output: tracked position of the vehicle, and covariance.

#2 ICP++

- Input:
  - 2 Point Clouds (w/o data association)

Register them.





#3 2D Loop Detector and Validator

- Input:
  - set of 2D point scans
  - a reference scan

Find the transform between reference and each scan, if they match.

#4 Least Squares based 2D Bearing Only SLAM

Input:

- 2D Bearing only labeled observations
- Odometry

Output trajectory and map.

#5 2D Least Squares-based SCLAM

- Input:
  - Encoder ticks
  - Labeled landmark observations
- Output:
  - Map
  - Calibration Parameters

#6 3D Calibration

- Input:
  - Raw data
    - Camera tracking output
    - Encoder ticks

#7 Kalman based IMU SLAM

- Input:
  - G2o file with IMU measurements
  - unlabeled point observations

- Output:
  - Trajectory and map

#8 Find that object

- Input:
  - Cloud of an object
  - Cloud of a scene with the object inside
- Output:
  - Pose of the object in the cloud

#9 Monocular SLAM with odometry guess

- Input:
  - Monocular stream data
  - Synchronized odometry
  - Extrinsics, i.e. transform odometry/camera
- Platform Trajectory

#10
